

Production Data Acquisition (PDA)

Integrated and simple recording of production order times

Process overview: Production data acquisition

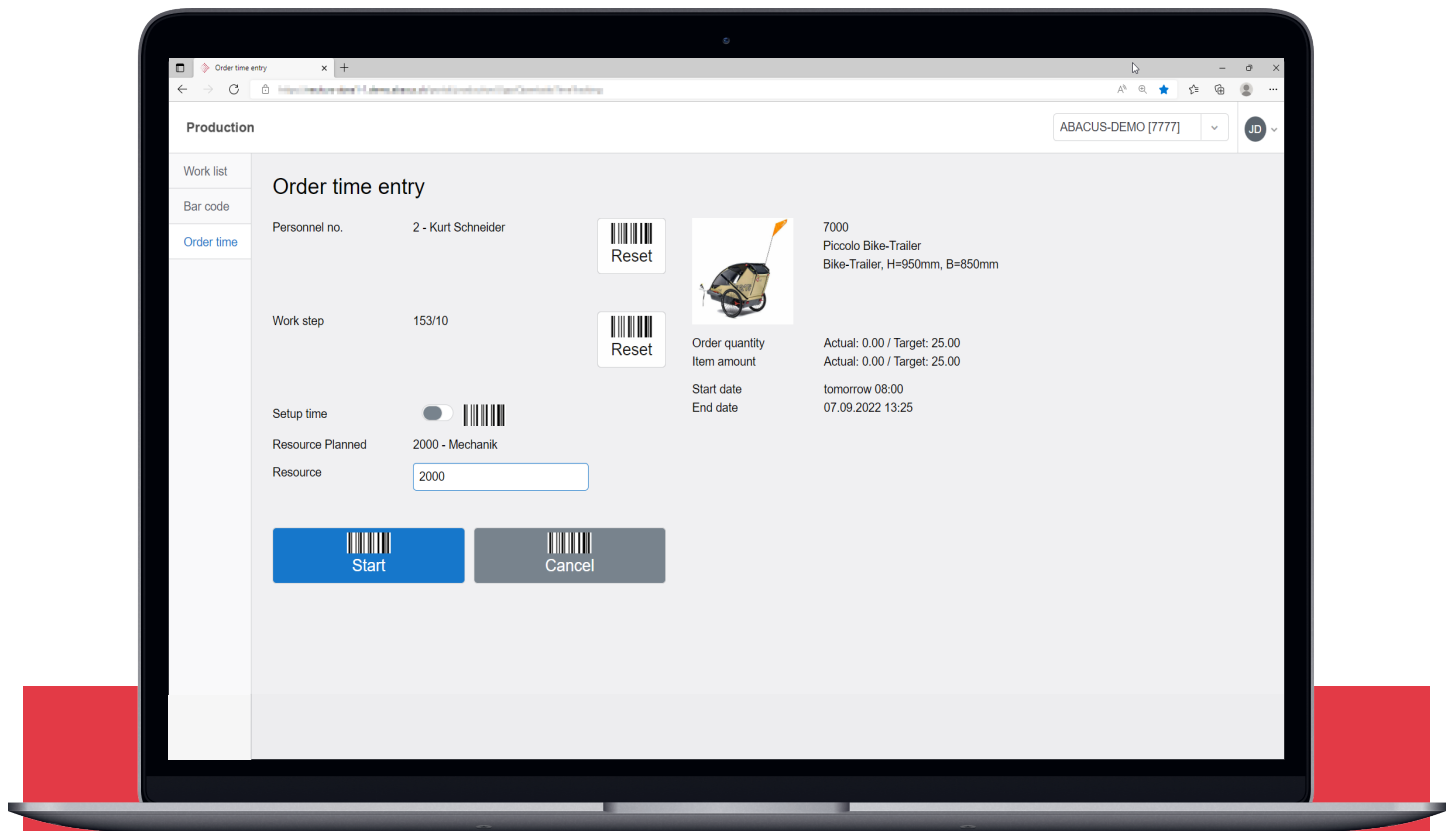

For the post-calculation and optimisation of work schedules, efficiently spent production time is an essential basis.

With the optional, integrated Production Data Acquisition (PDA) from Abacus, order times can be "stamped" directly by the production employees themselves. Production and operating times can be started and stopped via simple input screens or with a barcode reader. If required, qualitative data, e.g. yields, can be recorded in addition to quantitative data.

The individual dialogue control offers production staff the possibility to intuitively map resource-dependent data entry specifications. The entry can be made in the ERP itself or via the

PPS portal (browser-based application) and therefore also on a mobile device (tablet). The time worked on the order, including the optional additional information, is then automatically entered in the corresponding production order. If Abacus Time Recording is also used, break times between the recorded start and stop times are automatically deducted. This reduces the number of time stamps required by production staff, as they do not have to additionally stop and start break times. This integration also allows occupancy lists to be displayed, which provide an overview of who is working on what or who currently has no order time allocation.

Your benefits

- Production data acquisition very easily integrated into the ERP
- Individual dialogue control for resource-specific entries
- Entry at fixed workstation or mobile device (tablet)
- Optimised dialogues for operation via barcode reader
- Automatic booking of order times in comparison with the attendance time
- Production employee occupancy overviews (who is working on what)
- High data quality and thus meaningful post-calculation
